**TOPIC:- SEMAPHORES**

# Semaphores

- A *semaphore* is an object that consists of a **counter**, a **waiting list** of processes and two **methods** (e.g., functions): **signal** and **wait**.

# Semaphore Method: wait

```
void wait(sem S)
{
    S.count--;
    if (S.count < 0) {
        add the caller to the waiting list ;
        block() ;
    }
}
```

- ❑ After decreasing the counter by 1, if the counter value becomes negative, then
  - ❖ add the caller to the waiting list, and then
  - ❖ block itself.

# Semaphore Method: signal

```
void signal(sem S)
{
    S.count++;
    if (S.count <= 0) {
        remove a process P from the waiting list;
        resume (P) ;
    }
}
```

- ❑ After increasing the counter by 1, if the new counter value is not positive, then
  - ❖ remove a process **P** from the waiting list,
  - ❖ resume the execution of process **P**, and return

## Important Note: 1/4

<pre>S.count--; if (S.count&lt;0) {     add to list;     block(); }</pre>	<pre>S.count++; if (S.count&lt;=0) {     remove P;     resume(P); }</pre>
---	---

- ❑ If  $S.count < 0$ ,  $abs(S.count)$  is the number of waiting processes.
- ❑ This is because processes are added to (*resp.*, removed from) the waiting list only if the counter value is  $< 0$  (*resp.*,  $\leq 0$ ).

## Important Note: 2/4

<pre>S.count--; if (S.count&lt;0) {     add to list;     block(); }</pre>	<pre>S.count++; if (S.count&lt;=0) {     remove P;     resume(P); }</pre>
---	---

- ❑ The waiting list can be implemented with a queue if FIFO order is desired.
- ❑ However, the correctness of a program should not depend on a particular implementation of the waiting list.
- ❑ Your program should not make any assumption about the ordering of the waiting list.

## Important Note: 3/4

<pre>S.count--; if (S.count&lt;0) {     add to list;     block(); }</pre>	<pre>S.count++; if (S.count&lt;=0) {     remove P;     resume(P); }</pre>
---	---

- ❑ The caller may be blocked in the call to `wait()`.
- ❑ The caller never blocks in the call to `signal()`.  
If `S.count > 0`, `signal()` returns and the caller continues. Otherwise, a waiting process is released and the caller continues. In this case, *two* processes continue.

# The Most Important Note: 4/4

<pre>S.count--; if (S.count&lt;0) {     add to list;     block(); }</pre>	<pre>S.count++; if (S.count&lt;=0) {     remove P;     resume(P); }</pre>
---	---

- ❑ `wait()` and `signal()` must be executed *atomically* (i.e., as one **uninterruptible** unit).
- ❑ Otherwise, *race conditions* may occur.
- ❑ **Homework:** use execution sequences to show race conditions if `wait()` and/or `signal()` is not executed atomically.

# Three Typical Uses of Semaphores

□ There are three typical uses of semaphores:

❖ **mutual exclusion:**

Mutex (*i.e.*, *Mutual Exclusion*) locks

❖ **count-down lock:**

Keep in mind that semaphores have a counter.

❖ **notification:**

Indicate an event has occurred.

# Use 1: Mutual Exclusion (Lock)

semaphore **S = 1;** *initialization is important*  
int count = 0;

Process 1	Process 2
while (1) {	while (1) {
// do something entry	// do something
S.wait();	S.wait();
count++;	count--;
S.signal();	S.signal();
// do something exit	// do something
}	}

- ❑ What if the initial value of S is zero?
- ❑ S is a *binary semaphore* (similar to a *lock*).

## Use 2: Count-Down Counter

semaphore S = 3;

### Process 1

```
while (1) {  
    // do something  
    S.wait();  
    S.signal();  
    // do something  
}
```

### Process 2

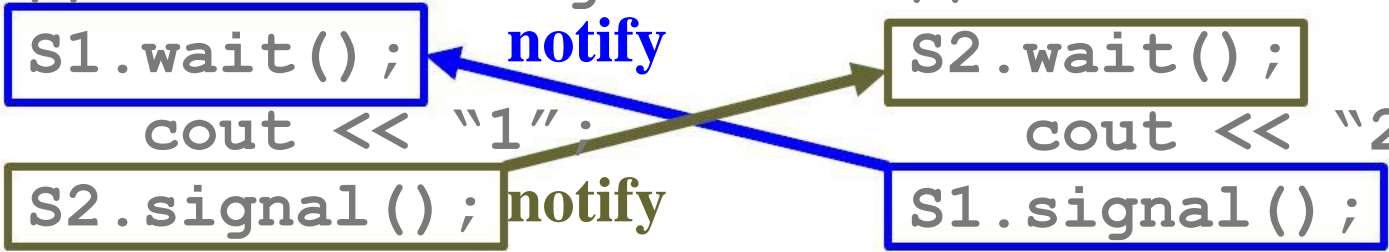

```
while (1) {  
    // do something  
    S.wait();  
    S.signal();  
    // do something  
}
```

at most 3 processes can be here!!!

- ❑ After **three** processes pass through `wait()`, this **section** is locked until a process calls `signal()`.

## Use 3: Notification

```
semaphore S1 = 1, S2 = 0;
```

process 1		process 2
<pre>while (1) {     // do something     S1.wait();     cout &lt;&lt; "1";     S2.signal();     // do something }</pre>		<pre>while (1) {     // do something     S2.wait();     cout &lt;&lt; "2";     S1.signal();     // do something }</pre>

- ☐ Process 1 uses `S2.signal()` to notify process 2, indicating **“I am done. Please go ahead.”**
- ☐ The output is 1 2 1 2 1 2 .....
- ☐ What if both S1 and S2 are both 0's or both 1's?
- ☐ What if S1= 0 and S2= 1?
